## WEIGHT DISTRIBUTION AT EACH MOUNTING HOLE — lbs (kg)

Unit 30HWC,S	Compr. End (4 Places)	Control Box End (4 Places)
018	171 ( 77.6)	136 (61.7)
025	195 ( 88.9)	144 (65.3)
028	211 ( 95.7)	160 (72.6)
035	216 ( 98.0)	161 (73.0)
040	240 (108.9)	185 (83.9)

### NOTES:

1. Operating weight includes weight of water and refrigerant.
2. Denotes center of gravity.
3. Denotes accessory or factory-installed option.
4. Dimensions in ( ) are in millimeters and weights ( ) are in kilograms.

# Application data

## Leveling unit

To ensure proper oil return, be sure that unit is level, particularly in its major lengthwise dimension, as compressor oil return piping runs in that direction.

It should be determined prior to installation if any special treatment is required to ensure a level installation.

## Cooler fluid temperature

1. Maximum sustained leaving chilled-fluid temperature (LCWT) is 60 F (16 C). For sustained operation, entering-fluid temperature should not exceed 75 F (24 C). Unit can start and pull down with up to 95 F (35 C) entering-fluid temperature due to MOP (maximum operating pressure) feature of the expansion valve.
2. Minimum LCWT for standard units is 40 F (4 C). Lower LCWT can be used on medium temperature brine applications. Refer to Medium Temperature Brine Applications section below. For applications with ratings below 40 F (4 C) on standard units, contact your local Carrier representative.

## Medium Temperature Brine Applications

In all brine duty applications, a suitable brine (or antifreeze and water solution) must be provided to ensure freeze protection. The solution crystallization point of the brine should be below the suction temperature of the cooler, and at least 15° F (8.3° C) below the leaving brine temperature. The brine solution must also be properly inhibited to provide suitable corrosion protection.

NOTE: Medium temperature brine is a special order option on 30HK,HL units.

## Condenser (30HWB,C,S and 30HK units) water temperature

1. Maximum leaving condenser-water temperature is 130 F (54 C) for 30HW 50 Hz units, and 104 F (40 C) for 60 Hz units and 30HK 50 Hz units.
2. Minimum entering condenser-water temperature without condenser flow regulation is 70 F (21 C).

## Cooler and water-cooled condenser flow range

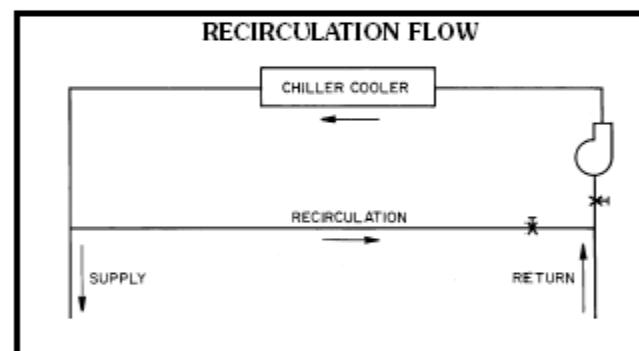

Ratings and performance data in this publication are for a cooling temperature rise of 10° F (5.6° C) and are suitable for a range from 5 to 15° F (2.8 to 8.3° C) temperature rise without adjustment. Units may be operated at a different temperature range, provided flow limits are not exceeded and corrections to capacity, etc. are made. For minimum flow rates, see Minimum Cooler and Condenser Flow Rates and Minimum Loop Volume table. High flow rate is limited by pressure drop that can be tolerated. If another temperature rise is used, apply LCWT correction as given in Capacity Correction and Selection Procedure sections on pages 18 and 20.

exceeded and corrections to capacity, etc. are made. For minimum flow rates, see Minimum Cooler and Condenser Flow Rates and Minimum Loop Volume table. High flow rate is limited by pressure drop that can be tolerated. If another temperature rise is used, apply LCWT correction as given in Capacity Correction and Selection Procedure sections on pages 18 and 20.

**Minimum cooler flow** — The minimum cooler flow (maximum cooler temperature rise) for standard units is shown in Minimum Cooler and Condenser Flow Rates and Minimum Loop Volume table below. When gpm (L/s) required is lower (or rise is higher), follow recommendations below:

- a. Multiple smaller chillers may be applied in series, each providing a portion of the design temperature rise.
- b. Chilled fluid may be recirculated to raise flow rate. However, the mixed temperature entering the cooler must be maintained at a minimum of at least 5° F (2.8° C) above the leaving chilled fluid temperature.
- c. On 30HK,HL units, special baffling is required to allow minimum flow rate to be reduced to 12%.

NOTE: Recirculation flow is shown below.

**Maximum cooler flow (5 gpm/ton or < 5° F rise [0.09 L/s • kW or < 2.7° C rise])** — The maximum cooler flow results in practical maximum pressure drop through cooler.

The return fluid may bypass the cooler to keep pressure drop through the cooler within acceptable limits. This permits a higher ΔT with lower fluid flow through cooler and mixing after cooler.

NOTE: Bypass flow is shown on page 17.

## MINIMUM COOLER AND CONDENSER FLOW RATES AND MINIMUM LOOP VOLUME

### LEGEND

ARI — Air Conditioning and Refrigeration Institute  
N — Liters per kW  
V — Gallons per ton

\*30HWB,C,S, and 30HK only.

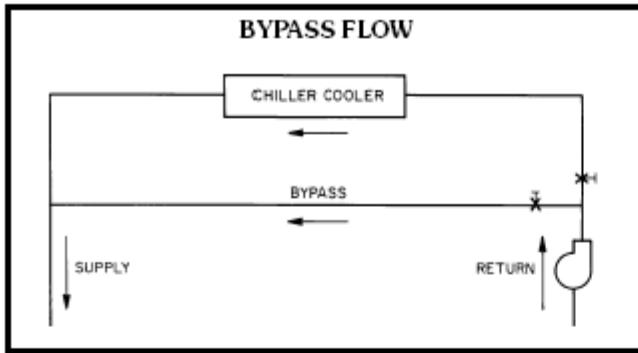

†Minimum system fluid volumes.

### NOTES:

Gallons = V x ARI capacity in tons.  
Liters = N x ARI capacity in kW.

UNIT SIZE	COOLER		CONDENSER*		MINIMUM COOLER LOOP VOLUME†	
	Gal./Min	L/s	Gal./Min	L/s	Gal.	L
30HW018	22.5	1.4	22.5	1.4	44	167
30HW025	30.0	1.9	30.0	1.9	59	223
30HW028	37.5	2.4	37.5	2.4	76	288
30HW035	45.0	2.8	45.0	2.8	85	322
30HW040	57.0	3.6	57.0	3.6	113	428
30HK040	56.0	3.5	67.0	4.2	120	454
30HK,HL050	68.0	4.3	76.0	4.8	148	560
30HK,HL060	68.0	4.3	83.0	5.2	174	659

APPLICATION	V	N
Normal Air Conditioning	3	3.25
Process Type Cooling	6 to 10	6.5 to 10.8
Low Ambient Operation	6 to 10	6.5 to 10.8

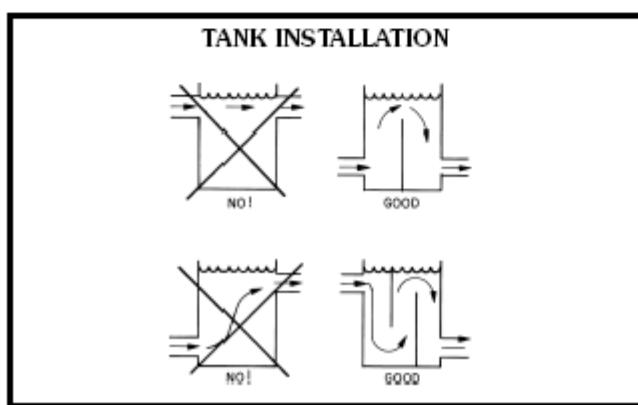

**Variable cooler flow rates** — These variable rates may be applied to standard chillers. However, the unit will attempt to maintain a constant leaving chilled-fluid temperature. In such cases, minimum fluid loop volume must be in excess of 3 gallons per ton (3.2 L per kW), and flow rate must change in steps of less than 10% per minute. Apply 6 gal per ton (6.5 L per kW) fluid loop volume minimum if flow rate changes more rapidly.

**Minimum water-cooled condenser flow** — This value (maximum rise) is shown in Minimum Cooler and Condenser Flow Rates and Minimum Loop Volume table on page 16. Condensers may be piped in series. Ensure leaving-water temperature does not exceed 104 F (40 C).

**Chilled fluid loop volume** — The chilled fluid loop volume in circulation must equal or exceed 3 gal per ton of cooling (3.25 L per kW) for temperature stability and accuracy in normal air conditioning applications. (For example, a 30HW040 would require 113 gal [428 L] in circulation in system loop — see Minimum Cooler and Condenser Flow Rates and Minimum Loop Volume table on page 16.) For process jobs where accuracy is vital or for operation at ambient temperature below 32 F (0° C) with low unit loading conditions, there should be from 6 to 10 gal per ton (6.5 to 10.8 L per kW). To achieve this volume, it is often necessary to install a tank in the loop. Tank should be baffled to ensure there is no stratification, and that water (or brine) entering tank is adequately mixed with liquid in the tank.

NOTE: Tank installation is shown below.

**Fouling factor** — The factor used to calculate tabulated ratings was  $0.00010 \text{ ft}^2 \cdot \text{hr} \cdot \text{F/Btu} (.000018 \text{ m}^2 \cdot \text{k/W})$ . As fouling factor is increased, unit capacity decreases and compressor power increases. To determine selections at other fouling factors, use chiller program in the Electronic Catalog.

### 30HWA and 30HL remote condenser requirements

1. Ensure each refrigerant circuit has its own head pressure control.
2. Condenser must provide 15° F (8.3° C) subcooling, a maximum of 40° F (22.2° C) difference between saturated condensing temperature and outdoor ambient temperature (to prevent overload at high ambient temperatures), and a minimum of 20° F (11.1° C) difference (to ensure subcooling).
3. Do not manifold independent refrigerant circuits into a single condenser.
4. Condenser should not be located more than 50 ft (15 m) below chiller to maintain subcooling.
5. Design discharge and liquid piping according to Carrier System Design Manual.

### Oversizing chillers

Oversizing chillers by more than 15% at design conditions must be avoided as the system operating efficiency will be adversely affected (resulting in greater and/or excessive electrical demand and cycling of compressors). When future expansion of equipment is anticipated, install a single chiller to meet present load requirements and install a second chiller to meet the additional load demand.

It is also recommended that the installation of 2 smaller chillers be considered where operation at minimum load is critical. The operation of a smaller chiller loaded to a greater percent of minimum is preferred to operating a single chiller at or near its minimum recommended value.

Hot gas bypass should not be used as a means to allow oversizing chillers. Hot gas bypass should be given consideration where substantial operating time is anticipated below the minimum unloading step.

### Strainers

A strainer with a minimum of 20 mesh must be installed in both the cooler fluid and condenser water inlet lines on 30HWB,C,S and 30HK units, just ahead of and as close as possible to the cooler and condenser. For 30HWA and 30HL units, this requirement applies only to the cooler.

### Parallel chillers

Where chiller capacities greater than can be supplied by a single 30H chiller are required, or where stand-by capability is desired, chillers may be installed in parallel. Units may be of the same or different sizes. However, cooler and condenser flow rates must be balanced to ensure proper flow to each chiller. The accessory Chillervisor System Manager III control should be used for proper leaving chilled fluid temperature control and to ensure proper staging sequence of up to 8 chillers. Refer to the accessory Chillervisor System Manager III control installation instructions for further details.

# Application data (cont)

## Series chillers

Where a large temperature drop (greater than 25 F [13.9 C]) is desired and higher fluid pressure drop across the cooler can be tolerated, chillers may be installed in series. The leaving fluid temperature sensors need not be relocated. However, the cooler minimum entering fluid temperature limitations should be considered for the chillers located downstream of other chillers. Condensers should be piped in parallel to maximize capacity and efficiency. This should also minimize condenser pressure drop and saturated condensing temperatures. However, if condensers are piped in series, ensure that the leaving water temperature does not exceed 104 F (40 C) for 60 Hz units or 130 F (54 C) for 50 Hz units.

## Energy management

Demand limiting and load shedding are popular techniques used to reduce peak electric demands typically experienced during hot summer days when air conditioning loads are highest. When utility electricity demands exceed a certain level, electrical loads are turned off to keep the peak demands below a prescribed maximum limit. Compressor unloading will reduce electrical demand while allowing the chiller to operate under part-load capacity and maintain partial chilled fluid cooling. The Energy Management Module can be added to accomplish this.

Electrical demand may be limited by unloading the chiller to a predetermined percentage of the load. One stage of unloading can be initiated by a remote signal to significantly reduce the chiller power consumption. This power reduction applies to the full load power at nominal conditions. The demand limit control should not be cycled less than 10 minutes on and 5 minutes off.

## Duty cycling

Duty cycling will cycle an electrical load at regular intervals, regardless of electrical demand. This reduces the electrical demand by "fooling" demand measuring devices. Duty cycling of the entire compressor is **NOT** recommended since motor windings and bearings will be damaged by constant cycling.

## Part-wind start (option for 30HW025-040 units, special order for 30HK,HL units)

Part-wind start is not generally required on 30HK,HL chillers due to use of multiple small compressors allowing smaller load increments, but is available if required. Maximum instantaneous current flow should be used in determining need.

The instantaneous current flow experienced during chiller start-up is a function of the compressor motor locked rotor amps (LRA). The LRA draw occurs briefly when the compressor is started and can lead to a peak in the electrical demand. Chillers with part-wind compressors have 2 sets of compressor motor windings (per compressor) to allow for reduced instantaneous current flow during compressor start-up.

## Vibration isolation

All compressors are spring isolated. External vibration isolation is not generally required, but is available for 30HW units as an accessory if desired.

## Cooler and water-cooled condenser freeze protection

If chiller or fluid lines are in an area where ambient conditions fall below 32 F (0° C), it is recommended that an antifreeze solution be added to protect the unit and fluid piping to a temperature 15° F (8.3° C) below the lowest anticipated ambient temperature. In brine duty applications where the leaving cooler fluid temperature is below 40 F (4.4 C), the brine solution (antifreeze) option (30HW; special order on 30HK,HL) should be selected so that the freeze point is at least 15° F (8.3° C) below the cooler leaving fluid temperature and below the suction temperature at the cooler. Corrections to performance as indicated in the Capacity Correction and Selection Procedure sections below and on page 20 must be applied.

Use only antifreeze solutions approved for heat exchanger duty. Use of automotive antifreezes is not recommended because of the fouling that can occur once their relatively short-lived inhibitor breaks down.

If not protected with an antifreeze solution, draining cooler and outdoor piping is recommended if system is not to be used during freezing weather conditions.

## Capacity correction (antifreeze)

If unit or fluid lines connected to the unit are in an area where ambient temperature falls below 32 F (0° C), it is strongly recommended that an appropriate antifreeze solution with suitable corrosion inhibitor be used in the chilled fluid circuit. Unit performance data based on inhibited ethylene glycol solution must be corrected as shown in the following example (other antifreeze solutions may be suitable based on specific application requirements).

NOTE: For performance correction factors for systems using propylene glycol solution, see Propylene Glycol Performance Correction Factors and Solution Crystallization Points Graph on page 19.

## EXAMPLE — ENGLISH (60 Hz)

### I. Determine concentration of inhibited ethylene glycol (EG) solution required to protect the system to 0° F (at zero flow).

From Solution Crystallization Point correction curve on page 19: 35% EG concentration is required for solution crystallization at 0° F.

Consider the 30HWB040 unit selected in the Selection Procedure section on page 20.

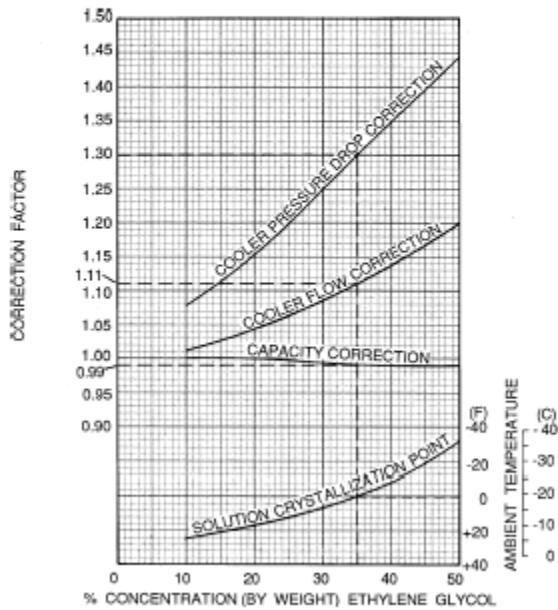

### II. Correct unit capacity.

On Capacity Correction curve on page 19, read 0.99 correction factor at 35% concentration.

$$\begin{aligned}\text{Corrected Capacity} &= 0.99 \times \text{Rated Capacity} \\ &= 0.99 \times 35.9 \\ &= 35.5 \text{ Tons}\end{aligned}$$

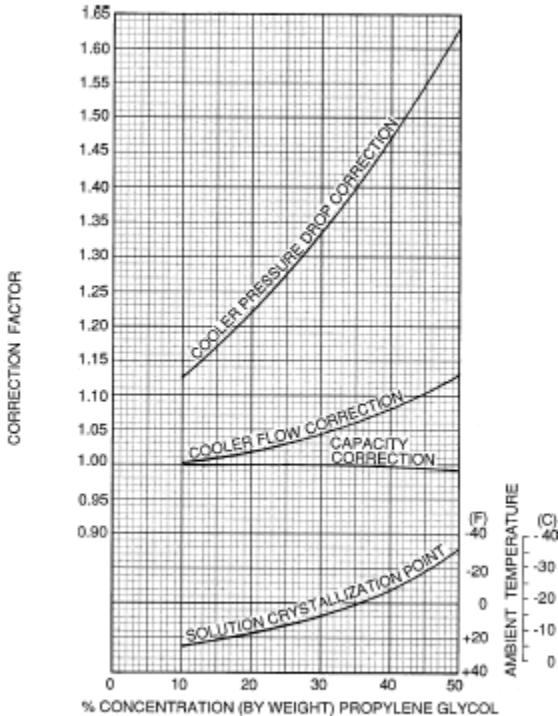

### ETHYLENE GLYCOL PERFORMANCE CORRECTION FACTORS AND SOLUTION CRYSTALLIZATION POINTS

Correction factors apply to published chilled water performance ratings from 40 to 60 F (4.4 to 15.6 C) LCWT.

### PROPYLENE GLYCOL PERFORMANCE CORRECTION FACTORS AND SOLUTION CRYSTALLIZATION POINTS

Correction factors apply to published chilled water performance ratings from 40 to 60 F (4.4 to 15.6 C) LCWT.

### III. Correct cooler water flow rate (Gpm).

On Cooler Flow Correction curve on this page, read 1.11 correction factor at 35% concentration.

$$\text{Cooler Water Flow} = \frac{\text{Tons} \times 24}{\Delta T} = \frac{35.5 \times 24}{10} = 85.3 \text{ Gpm}$$

$$\text{Cooler Water Flow} = 1.11 \times 85.3 = 94.7 \text{ Gpm}$$

### IV. Correct cooler pressure drop.

On Cooler Pressure Drop Correction curve on this page, read 1.30 correction factor at 35% concentration.

On Cooler Pressure Drop curve, (page 22) for 94.7 gpm of water, Pressure Drop = 7.0 ft of water.

$$\begin{aligned} \text{For 35% EG solution, } &= 1.30 \times 7.0 \\ \text{Pressure Drop} &= 9.1 \text{ ft of water} \end{aligned}$$

### EXAMPLE — SI (50 Hz)

#### I. Determine concentration of inhibited ethylene glycol (EG) solution required to protect the system to -17.8 C (at zero flow).

From Solution Crystallization Point correction curve at left: 35% EG concentration is required for solution crystallization at -17.8 C.

Consider the 30HWB040 unit selected in the Selection Procedure example.

#### II. Correct unit capacity.

On Capacity Correction curve on this page, read 0.99 correction factor at 35% concentration.

$$\begin{aligned} \text{Corrected Capacity} &= 0.99 \times \text{Rated Capacity} \\ &= 0.99 \times 112.1 \\ &= 111.0 \text{ kW} \end{aligned}$$

#### III. Correct cooler water flow rate (L/s).

On Cooler Flow Correction curve on this page, read 1.11 correction factor at 35% concentration.

$$\begin{aligned} \text{Cooler Water Flow} &= \frac{\text{kW} \times 239}{\Delta T} \\ (\text{at corrected capacity}) &= \frac{111.0 \times .239}{5.6} \\ &= 4.7 \text{ L/s} \end{aligned}$$

$$\text{Cooler Water Flow} = 1.11 \times 4.7 = 5.26 \text{ L/s}$$

#### IV. Correct cooler pressure drop.

On Cooler Pressure Drop Correction curve on this page, read 1.30 correction factor at 35% concentration.

On Cooler Pressure Drop curve (page 22), for 5.5 L/s of water, Pressure Drop = 20.0 kPa.

$$\begin{aligned} \text{For 35% EG solution, } &= 1.30 \times 20.0 \\ \text{Pressure Drop} &= 26.0 \text{ kPa} \end{aligned}$$

### LEGEND

**ARI** — Air Conditioning and Refrigeration Institute (U.S.A.)  
**EER** — Energy Efficiency Ratio (Capacity [Btuh] / Input Power [W])  
**IPLV** — Integrated Part-Load Value

### NOTES:

1. Rated (60 Hz only) in accordance with ARI Standard 550/590-98 at standard rating conditions.
2. Standard rating conditions are as follows:

#### Cooler Conditions:

Leaving water temperature: 44 F (6.7 C)  
 Flow: 2.4 gpm (.15 L/s)

#### Condenser Conditions:

Entering water temperature: 85 F (29.4 C)  
 Flow: 3 gpm per ton (0.054 L/s per kW)

#### Fouling Factor (Cooler and Condenser):

0.00010 hr x sq ft x F per Btuh  
 (0.000018 m<sup>2</sup> x k per W)

3. IPLV is a single number part-load efficiency value calculated from the system full-load efficiency values and corrected for a typical building air-conditioning application.

4. All data in this table is rated (60 Hz only) in accordance with ARI Standard 550/590-98 as represented in the Reciprocating Chiller Selection Program (E-Cat) version 2.11.

Rated in accordance with  
ARI Standard 550/590-98.
