E200-340 SED/AUG 99

FILE: EQUIPMENT MANUAL - SECTION 200

REPLACES: E200-340 SED/MAR 99

DISTRIBUTION: 1, 1a, 1c, 4, 4c,

STANDARD FEATURES**CASING**

The unit casing is fabricated with heavy gauge corrosion resistant galvanized steel. Fan sections are compartmented to allow fan cycling and to prevent idle fans from turning in reverse. Fan panels have smooth surfaced, large radius orifices for efficient fan performance.

COIL

The cooling coil is constructed with steel tubes and fins. Tubes are staggered in the direction of air flow to assure maximum air turbulence and coil heat transfer efficiency.

The coil is available with 3, 4 or 6 fins per inch with tubes and fins supported by heavy gauge flanged tube sheets. The entire coil assembly is hot dip galvanized after fabrication. Coils are submersion tested before and after galvanizing with 350 psig air pressure, yielding a design working pressure of 280 psig.

Each coil is circuited for design operating conditions. This assures proper refrigerant mass velocities through the tubes and that refrigerant pressure drops will be kept to a minimum.

All coils can be circuited for:

Liquid Recirculation	Direct Expansion
Flooded	Brine Circulation
Controlled Pressure	Heat Reclaim

DRAIN PAN

The drain pan is constructed of heavy gauge galvanized steel and shipped in place on the unit. All pans are smooth surfaced, sloped end to end to assure rapid and complete drainage.

MOTORS & FANS

The fan motors are TEAO (Totally Enclosed Air Over) three phase, ball bearing, 1140 rpm with internal thermal overload protection. Low temperature grease is provided.

Direct drive axial propeller fans are of heavy duty construction. Fan guards meet OSHA standards, and are PVC coated.

OPTIONAL ARRANGEMENTS**INSULATED DRAIN PAN**

High efficiency foam insulation is positioned between the inner drain pan and outer cover. Both the inner drain pan and outer cover are fabricated from mill galvanized steel as standard. Stainless steel pans and pan covers are also available.

HOT GAS HEATED DRAIN PAN

A pan coil is attached to the underside of the inner pan. This allows access to the drain pan and a smooth surfaced pan interior for ease of cleaning. The coil is circuited to provide fast, efficient defrost. Pan coils are piped in series with the cooling coil to provide a single hot gas inlet. For selected liquid over-feed applications, the pan coil can be piped in parallel to the cooling coil.

PAN COIL CHECK VALVE

A check valve with piping is provided to connect the pan coil outlet with the cooling coil hot gas inlet, isolating the pan coil from refrigerant circulation during the refrigeration cycle.

WATER DEFROST

Spray trees with full coverage non-clogging nozzles and over-size drain pan and connections are provided. Spray tree and nozzles are easily accessible for inspection.

MOTORS & WIRING

230/1/60 single phase, is available on 1/3 and 1/2 HP motors. Individual fan motors can be factory prewired to a common junction box. A factory-mounted disconnect and a motor control center are also available.

CASING

The unit casing can be fabricated of heavy-gauge stainless steel.

VARIABLE FREQUENCY DRIVE

Motors suitable for variable frequency drives are available. Special motor and wiring arrangements are required for this option.

Note: This manual subject to change without notice.

RATING DATA

1. All coil capacities are based on sensible heat removal using liquid recirculated, controlled pressure, or flooded ammonia feed. See Capacity Correction Factors for other applications.
2. Temperature difference is the difference in degree F between the air entering the evaporator, or room air, and the coil saturated suction temperature as measured at the suction connection with a pressure gauge.
3. Multiply Btu/h per°F TD ratings by TD to determine product cooler sensible heat capacity. Use capacity correction multipliers as required.
4. Fan motor heat is not included in the ratings and must be added to the load estimate. Add 4000 Btu/h per horsepower to the room load.
5. Brine applications require factory engineered selections. Provide total load, room temperature, brine type and concentration, supply temperature and GPM.
6. Sound level in dB(A) is per fan manufacturer's data and is an average sound pressure reading considering the entire performance range of the fan. It represents the noise that might be expected at a distance of 6 feet from the fan in a room having a combination of hard and soft surfaces. In multiple unit applications, the sound levels will be higher. Overall sound pressure will vary with room size, shape, temperature, and acoustic absorption.
7. Controlled Pressure Receiver:
Liquid feed from controlled pressure receivers will be at mixed liquid temperature between the saturated temperature at receiver pressure and the return liquid temperature from the accumulator. Special circuiting limitations and defrost piping options may apply. Mixed liquid temperature and receiver pressure must be furnished with the order.
8. Direct Expansion Feed Limitations:
 - Liquid feed to thermostatic expansion valves must have at least 5° F liquid subcooling year round.
 - The liquid temperature entering the expansion valve must be at least 30° F higher than coil suction temperature.
 - A minimum 10° F temperature difference is required between room air and coil saturated suction temperature.

Notes

- (1) Liquid and suction connection sizes may not be the required line sizes to meet system design requirements.
- (2) Recirculated line sizes are based on pumped liquid feed. Ammonia = 3:1 overfeed, R-22 = 2:1 overfeed.
- (3) Hot-dip galvanized steel coils for direct expansion R-22 will have brass distributors for direct connection to expansion valve.
- (4) For low temperature (-20°F or below) flooded operation, two liquid leg connections may be required.
- (5) Direct expansion R-22 outside of listed range may require multiple liquid inlets and suction connections.
- (6) Hot gas pan coil connection is 1 1/4".
- (7) Liquid inlet is for DX applications dependent upon distributor selection and requires evaluation on a case by case basis.

**COIL CONSTRUCTION**

S - Hot Dipped Galvanized Steel

NUMBER of FANS

1 through 8

ROWS DEEP

6 or 8

FIN SPACINGS

3 - 3 FPI

4 - 4 FPI

6 - 6 FPI

MODULE SIZES

S - Short

M - Medium

T - Tall

X - Tall, Extra Width

APPLICATION RANGES

L - Below +32°F Room Temperature Only

H - All Temperature Ranges

AIR FLOW DIRECTIONS

D - Draw through

B - Blow through

FEED TYPES

LB - Liquid recirculated bottom feed

LT - Liquid recirculated top feed

FL - Flooded feed

CB - Controlled pressure bottom feed

CT - Controlled pressure top feed

DX - Direct Expansion

BR - Brine or chilled water

SPEED CODE

- - 60Hz

DEFROST OPTIONS

HP - Hot gas coil and pan, piping, and check valve (parallel piped)

HS - Hot gas coil and pan, piping, and check valve (series piped)

HC - Hot gas coil only

WD - Water defrost

AD - Air defrost above 34°F room

BH - Hot brine, coil only, above 33°F room

BL - Hot brine, coil and pan, at or below 33°F room

VOLTAGE CODES

E - 208-230/460/3/60

J - 575/3/60

MOTOR WIRING OPTIONS

N - Motors not wired (standard)

W - Motors wired to common junction box

D - Motor wired to watertight, nonfused disconnect

C - Motor control center

DRAIN PAN OPTIONS

GG - Galvanized steel pan w/insulation and galvanized cover (standard)

GS - Galvanized steel pan w/insulation and stainless cover

SS - Stainless steel pan w/insulation and stainless cover

COIL AND DRAIN PAN CONNECTIONS

R - Right hand when facing fans.

L - Left hand when facing fans.

HOUSING OPTION (Omit if not used)

SH - Stainless housing. Fan guards are not stainless steel.

SPECIAL FEATURES (Omit if not used)

X - Describe fully special features such as control panels, disconnects, coil arrangements, that vary from our standard design.

(1) Shaded units have higher face velocities and should only be used in applications with room temperature below 32°F. Use in higher temperature rooms may result in moisture carryover.

(2) Ratings are for liquid recirculated, controlled pressure and flooded R-717.

(3) Noise levels are based on fan manufacturer's data. Actual levels may vary due to installation environment.

(1) Shaded units have higher face velocities and should only be used in applications with room temperature below 32°F. Use in higher temperature rooms may result in moisture carryover.

(2) Ratings are for liquid recirculated, controlled pressure and flooded R-717.

(3) Noise levels are based on fan manufacturer's data. Actual levels may vary due to installation environment.

(1) Shaded units have higher face velocities and should only be used in applications with room temperature below 32°F. Use in higher temperature rooms may result in moisture carryover.

(2) Ratings are for liquid recirculated, controlled pressure and flooded R-717.

(3) Noise levels are based on fan manufacturer's data. Actual levels may vary due to installation environment.
